1 What is this?

This is simply a long list of papers that I have found useful. They are generally related to aspects of the search for evidence that the Sun influences the climate somehow. There are papers on Data, on Methods and papers that just discuss the problems. So far the list is not structured, but it is planned that later versions will have lists that are sorted into general subject classes. If you find the idea useful and have some references to papers you'd like to see in the list, please send me an email.
